

PROGRAMAÇÃO PARA INTERNET II

JEFFERSON DIAS CARDOSO

EXPLORATORY RESEARCH

The United Nations (UN) has as one of the Sustainable Development Goals the "decent work and economic growth", this concerns the promotion of policies that support the training of labor, technological modernization and strengthening of policies to promote generation of jobs in search of full employment, among others.

Given this scenario, it is possible to draw a line with the so-called structural (or technological) unemployment, which occurs because the qualification (or training) of the workforce does not evolve at the same pace as technologies. In this way, those who do not qualify end up losing their position in the labor market.

Programs such as Mais Brasil, by the Federal Government, aim to provide technological training to reduce unemployment – offering courses and presentations in the technological field. Similar programs play a crucial role, especially for workers already in the market since knowledge of the sector can end up being outdated. However, these programs appear as palliative measures, and often follow a path of knowledge considering that the participant already has prior technological knowledge.

Although 82.7% of Brazilian households have access to the internet (IBGE, 2019), digital inclusion should not only focus on promoting access to technology, but also on the domain of tools, in which, through training courses (as basic information technology) it can be ensured the monitoring of technological evolution in an easier way so that it can continue or enter the labor market.
